Follows the adventures of detective Dave Robicheaux, who struggles with alcoholism and rage while fighting to protect lives in Katrina-devastated New Orleans. My study focuses on the effects of a severe storm event on headwater mountain stream morphology. In 1997 the Routt Divide Blowdown felled 13,000 acres of trees in the Routt National Forest, Colorado, causing massive amounts of large wood (LW) loading in streams. A previous study (Massey, 2000) established a 1998 baseline in three streams: Sanchez Creek (control stream with 0% blowdown, no human activity, no fire), Agnes Creek (88% blowdown, no human activity, fire-affected) and South Fork Lost Dog (SFLD) Creek (92% blowdown - past logging and road construction, fire-affected). I resurveyed the streams during the summers of 2010 and 2011. I mapped channel morphology, classified and quantified the number, location, and function of LW pieces within the stream channel, and measured pebble counts. SFLD Creek had a reach-averaged increase in cross-sectional area (1998-2010) of ~1 m² (~90%). Agnes Creek had a reach-averaged increase of ~0.1 m² (~25%). Sanchez Creek had a reach-averaged increase of ~0.5 m² (~45%). SFLD Creek became deeper by ~0.25 m (~65%), Agnes Creek became shallower by ~0.01 m (~3%), and Sanchez Creek became deeper by ~0.1 m (~35%). SFLD Creek was the only stream to have a coarsening trend in particle size. Comparisons of the channel margins surveyed in planview indicated changes in channel width. Agnes Creek widened by 1.5 m (~30%) whereas SFLD Creek narrowed by ~0.4 m (~20%). The map view of the control stream (Sanchez) was not surveyed in 2011 because of high snow pack. My initial hypothesis was that blowdown-related LW was a primary control on channel morphology over the 12-13 years study period. However, statistically significant differences in changes in area, width, and depth exist between SFLD and Agnes Creeks. In contrast, changes between Agnes and Sanchez Creeks were not statistically significant. This suggests other factors such as logging and road construction (as seen only in the SFLD Creek watershed) may play a larger role in channel morphology. To assess the importance of these factors on channel morphology,

further studies are needed, including discharge and bank stability data, as well as recent mapping of the control stream (Sanchez). The Boundary Waters Canoe Area Wilderness (BWCAW) was struck by a major windstorm on July 4, 1999. Estimated volume in blowdown areas was up to 29 percent less than in non-blowdown areas. Mean down woody fuel loadings were twice as high in blowdown areas than in non-blowdown areas. Overstory species diversity declined in blowdown areas, but understory diversity, measured by species richness, increased. Windstorms, like wildfire, are part of the historic disturbance regime in the Boundary Waters-Quetico region. The trajectory of a store which is released from an aircraft can be determined by model tests using a six-component sting balance to measure the aerodynamic forces and moments on the shell. This paper describes a completely self-contained Captive Trajectory System which has been configured to provide maximum efficiency in the use of wind tunnel test time. Three primary factors which contribute to achieving this goal are: the self-contained nature of the system; the use of high performance electrohydraulic servo positioning systems for all motions; and the use of a modern high speed minicomputer and appropriately matched amplifier/multiplexer I/O equipment to acquire information, perform the mathematical manipulations required, and provide appropriate inputs to the servo systems. This system contains four subsystems: the structural/mechanical system; the electrohydraulic positioning systems; the minicomputer based analyzer/programmer system; and the software system. An overview is given the wind tunnel circuit, a 4 ft x 4 ft (1.2 m x 1.2 m) trisonic blowdown which has been configured to provide high flow quality by use of a perforated sleeve valve flow control, perforated flow diffusers, acoustic baffles, a honeycomb, and screens. The popularity of the Boiler Operators Handbook has prompted the issue of this revised and completely updated edition, which examines the change of emphasis from coal-fired to oil- and gas-fired boilers. The new Boiler Operators Handbook will help the operator carry out his important work with skill and efficiency. The good management of a boiler plant should ensure the production of good quality steam in a safe and fuel-efficient manner to minimise air pollution. All these issues are emphasized throughout the new edition. The NIFES consulting group has been responsible for the training of boiler operators since 1954, and this high level of experience is combined with the very latest technological advances to make this new edition essential reading for the boiler operator. For Travis and Seth a dream canoe trip turns into a nightmare when a deadly windstorm flattens the surrounding forest. After one of the boys suffers an injury, the other must venture ahead on his own. But instead of finding help, the young man is caught in a life-or-death struggle to save himself. Readers of all ages will love this novel, part of Ron Gamer's outdoor adventure series. A novel on two immigrant boys growing up in 1940s Washington--their friendship, their loves and their crimes. One Greek, the other Italian, they are involved in collection work for loan sharks who prey on immigrants. By the author of Nick's Trip.
