This book, like all books, comes to an end, but that is by no means the end of the story of Open Space. In fact it is safe to say that we have barely begun. The total simplicity of Open Space (sit in a circle, create a bulletin board, open a marketplace, and go to work) contrasts radically with the quality of results and speed of achievement. The conventional theory and practice of meeting and organization would suggest that what happens in Open Space should not occur. But it does, not once but thousands of times in all parts of the world. So the continuing story of Open Space is all about this wonderful anomaly. Why does it work? How does it work? And perhaps most intriguing - if "it" works in Open Space (whatever "it" is) why couldn't it work twenty-four hours a day, seven days a week, 365 days of the year? My best guess is that the "it" is the primal power of self-organization, and if so the real significance of Open Space has little to do with better meetings, and everything to do with a deepening understanding of who we really are and how we might most effectively get on in this world. But all of that is an unfolding story and, as I would see it, a wonderful, ongoing natural experiment. And you are invited to participate. This User's Guide is intended to support the design, implementation, analysis, interpretation, and quality evaluation of registries created to increase understanding of patient outcomes. For the purposes of this guide, a patient registry is an organized system that uses observational study methods to collect uniform data (clinical and other) to evaluate specified outcomes for a population defined by a particular disease, condition, or exposure, and that serves one or more predetermined scientific, clinical, or policy purposes. A registry database is a file (or files) derived from the registry. Although registries can serve many purposes, this guide focuses on registries created for one or more of the following purposes: to describe the natural history of disease, to determine clinical effectiveness or cost-effectiveness of health care products and services, to measure or monitor safety and harm, and/or to measure quality of care. Registries are classified according to how their populations are defined. For example, product registries include patients who have been exposed to biopharmaceutical products or medical devices. Health services registries consist of patients who have had a common procedure, clinical encounter, or hospitalization. Disease or condition registries are defined by patients having the same diagnosis, such as cystic fibrosis or heart failure. The User's Guide was created by researchers affiliated with AHRQ's Effective Health Care Program, particularly those who participated in AHRQ's DEcIDE (Developing Evidence to Inform Decisions About Effectiveness) program. Chapters were subject to multiple internal and external independent reviews. Orients the new user to Window system concepts and provides detailed tutorials for many client programs, including the xterm terminal emulator and window managers.
